BASIC-ABSTRACT:

A toothbrush consists of a head (1) with bristles, a neck (2) and a handle (3),  
linked by a connecting element (4) with a tensioner.

The head of the toothbrush is made from a series of separate trapezoid components, joined by their larger ends so that their bristle tufts can move in a plane parallel to the base of the head. The flexible connecting element passes through the trapezoid components of the brush head and is tensioned by a

screw and nut (6, 5) on the end of the handle to vary the shape of the head according to the user's requirements.

ADVANTAGE - More convenient to use and adjust.
